## Raf Weather and eWeather modules compatible?

Posted by ThaSniper - 2008/10/20 03:03

---

Hello!

I like your approach for this module.

For me, it could be very useful because I could display like the Europe capitals weather.

I'm using the eWeather module, and will keep using because it displays detailed weather for a default city, or custom city if the user is logged.

So, my idea is to use both modules!

The problem is that both Raf Weather Module and eWeather Module interfere with each other. For example, users own default cities start showing on the Raf Module without my admin choice, just by logging in a user with different city preferences. And the eWeather module also start choosing not the default city, when no user is logged in.

Do you think it would be possible to fix this?

Thank you!

Hi!

Have you tried to disable "Integrate with user profile"?

Hello.

Thank you for the hint. I should have tested that.

Well, it interferes way less, not a problem anymore.

Thank you. I am now able to use both modules. :)
