
500 Internal Server Error

Posted by snk - 2007/11/27 05:58

Hello,

First I am sending you my congratulations of your good work, I like your module and I want to make it work. Unfortunately, whenever I activate it from the module list, my site goes down producing an error

500 Internal Server Error

Any idea to resolve that?

Thank you in advance

just to add some infos.

joomla 1.013
mysql 5x
php 4x 5x
apache2

This error sometimes appears due to incorrect permissions of the executed php file. Reinstall eWeather component and RafWeather module and try it with default configuration. Check your server log for more information.
