
Google search big question

Posted by Adolfs - 2008/05/02 19:34

First of all a great plug for joomla this is. Dzi ki.
Now. Here is the big one.

I have google search installed on 2 sites. One is the standard google and website search the other is custom google search.

I am wondering if it is in any way possible to take the search terms entered by the users and store them somewhere to be used in the tag cloud. In other words have a tag cloud built on what people are searching for?

This would be awesome i guess.

Hi!

What component/module are you using for google search?

Skorp

Cool to hear from you. I'm not using any component it's straight google search code into a user module.

I just had an idea. What if you used a hidden input field that would gather the terms, over the google search input area. Dunnow if that could even work but i hope you get what im saying.
