## Encoding problem

---

Hello. I searched for a tag cloud component for a long time, and Raf Cloud seems to be exactly what we needed. But there's a problem: my site is on russian language, in windows-1251 encoding. So most of key words is russian, and when i click on links from cloud, i can see search component results, but instead of required word it tries to search it in urlencode (#: %D1%80%D0%B0%D1%81%). At same time i can see the word in right code at page url (#: /component/searchword,đàñïëñàíèâ/option,com\_search/Itemid,108/), although on normal search it usually goes vice versa. ^^ I tried to change it, like delete urlencode() function from module or even add one more, but still the only result was encoded word in both url and search. -\_- Please, help if that possible.  
Site: <http://vdv-up.ru/>, tho you can't see that module right now - it's available for administration only for now since it's not working correctly.

PS: sorry if my english is a bit clumsy. ^^

Hi!

Did you try to set RafCloud module->SEF Urls to Internal link?
